steel plates

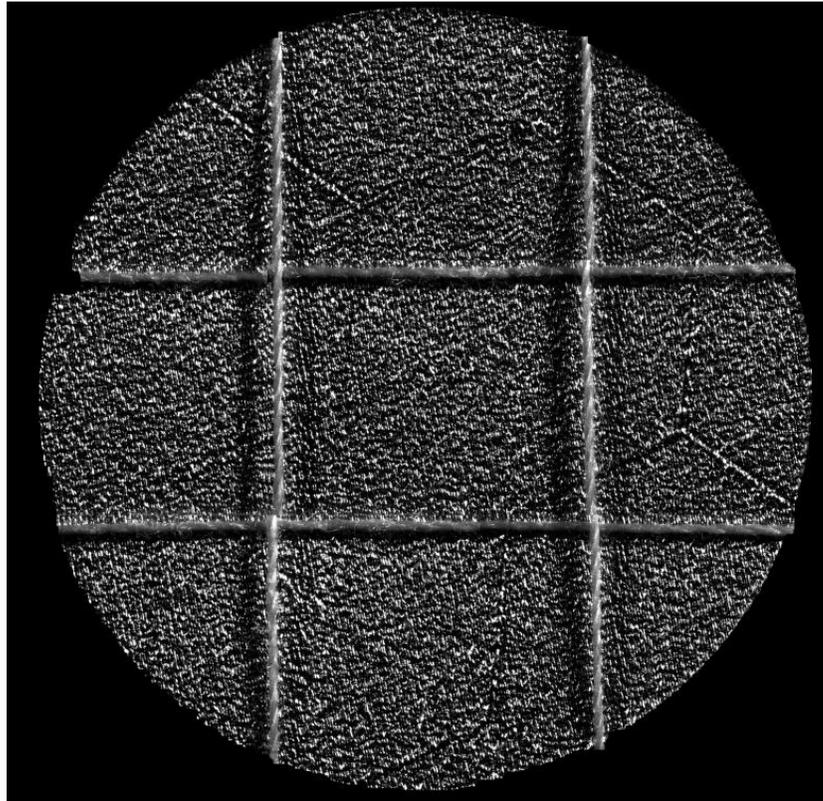

STEEL PLATE DEFECT PREDICTION

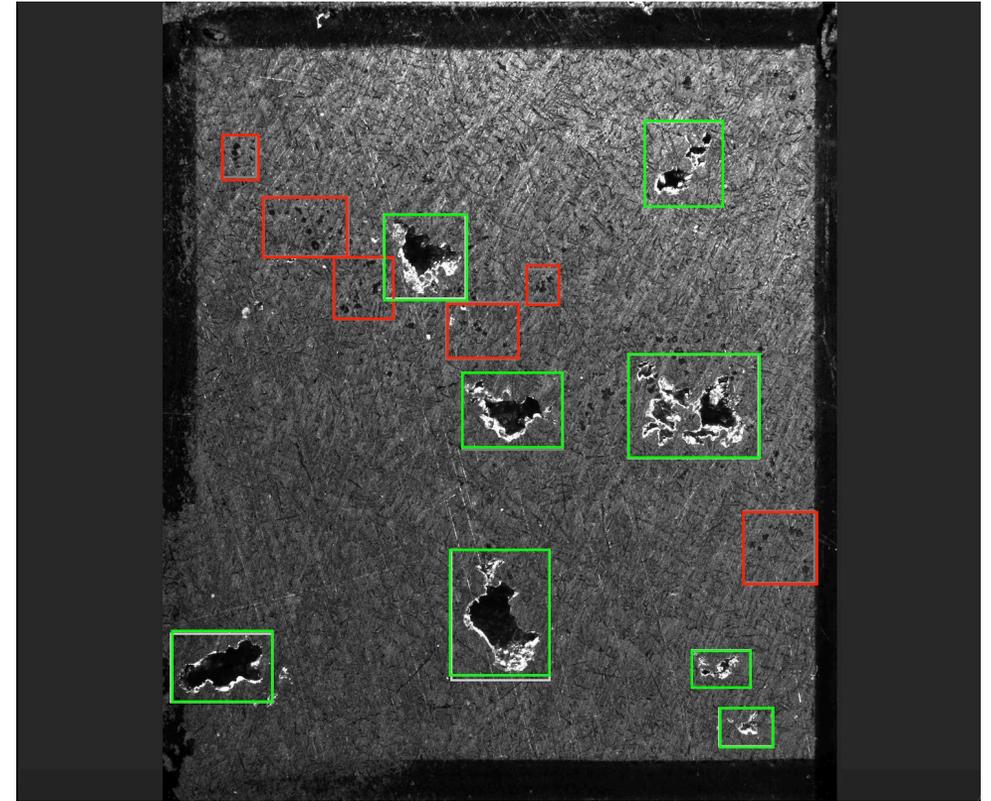

Hands on: Classifying surface defects in steel plates using Machine Learning

Hands on: Classifying surface defects in steel plates using Machine Learning

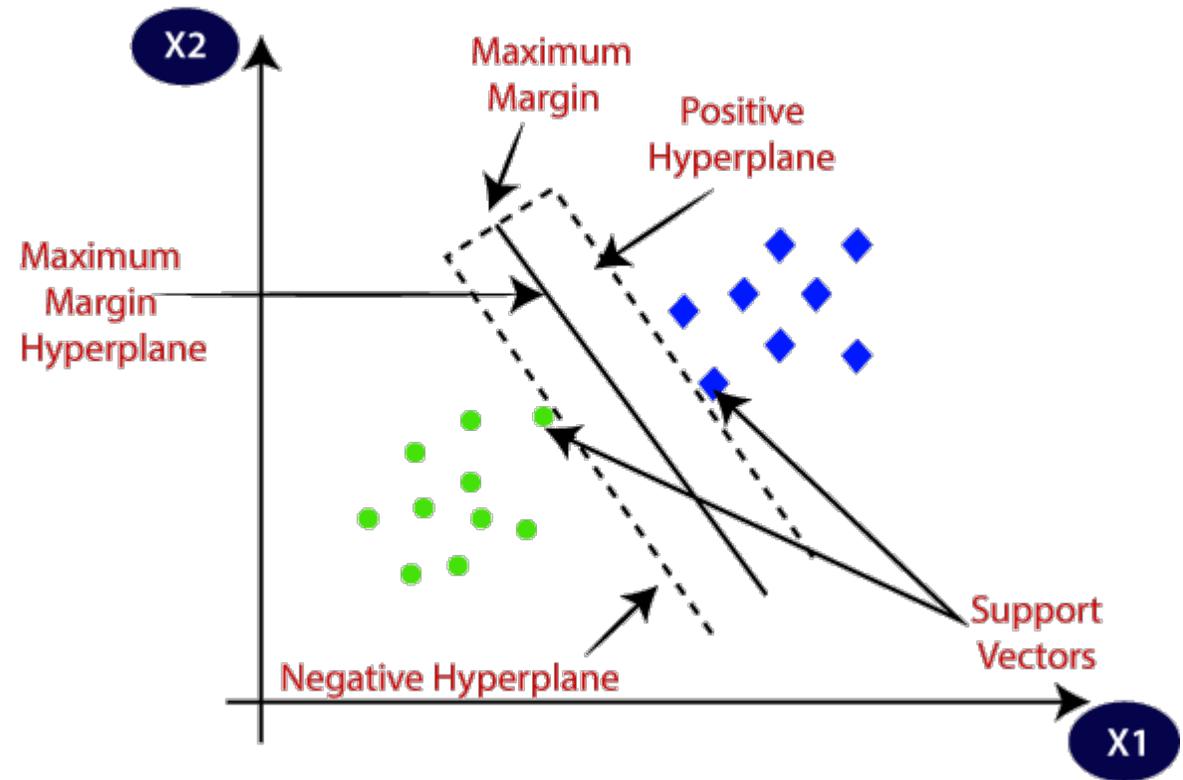

Roughness prediction

Porosity detection

Support Vector Machine (SVM)

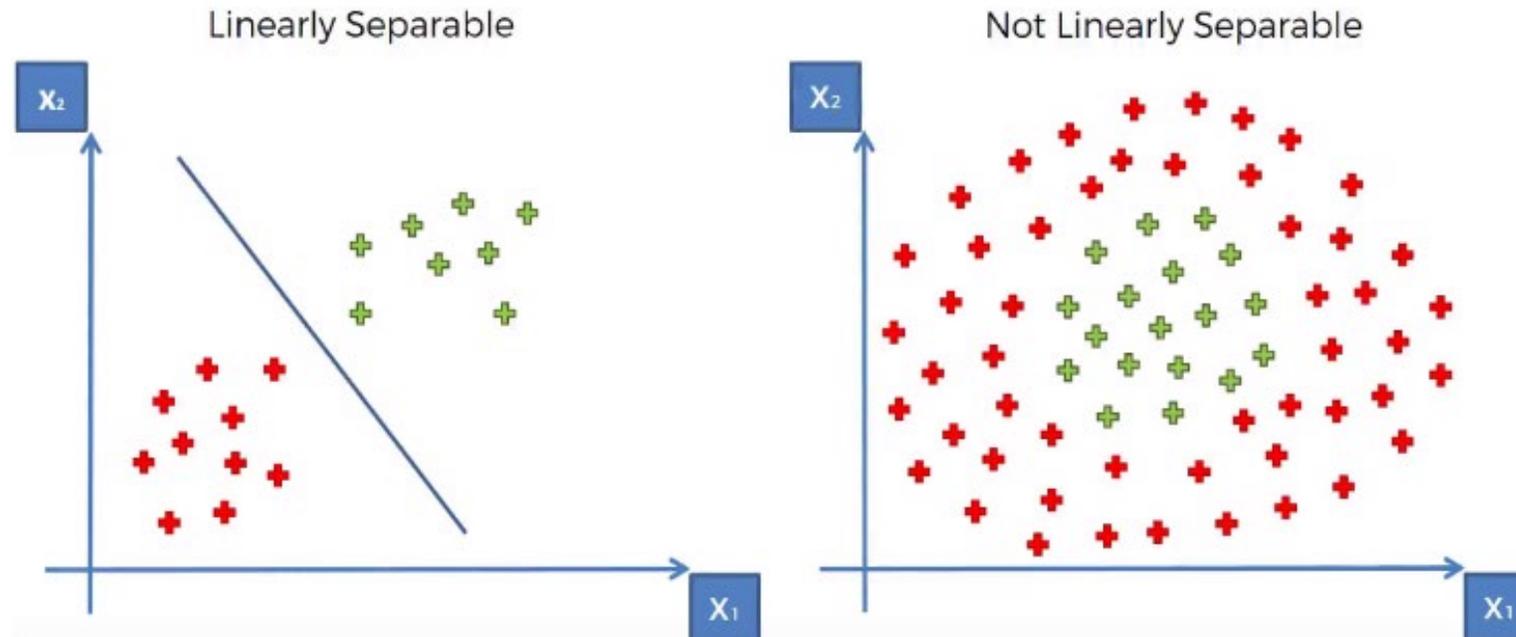

- SVM aims to find the hyperplane that maximizes the margin between different classes
- Supervised model for binary classification, regression and also multilabel and multiclass tasks

Support Vector Machine (SVM)

Kernel

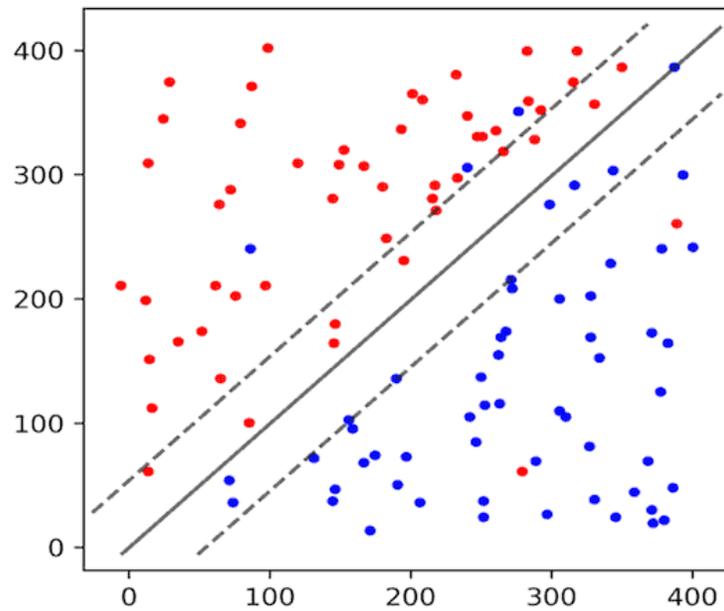

Kernel is to take data as input and transform it into the required form to make it separable

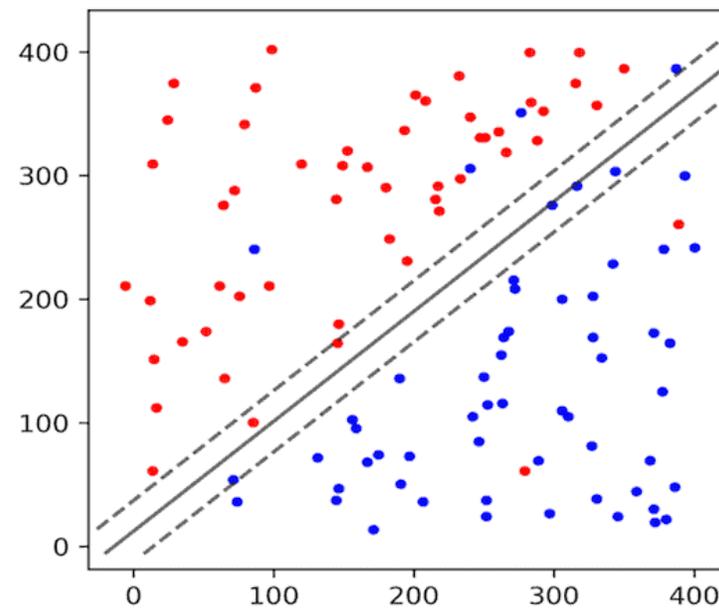

Support Vector Machine (SVM)

C parameter

The C parameter in SVM controls the trade-off between having a smooth decision boundary and correctly classifying training points. A **higher** C value may lead to overfitting

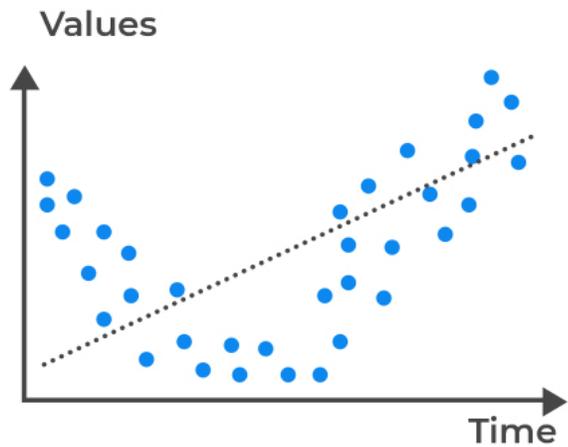

C = 1

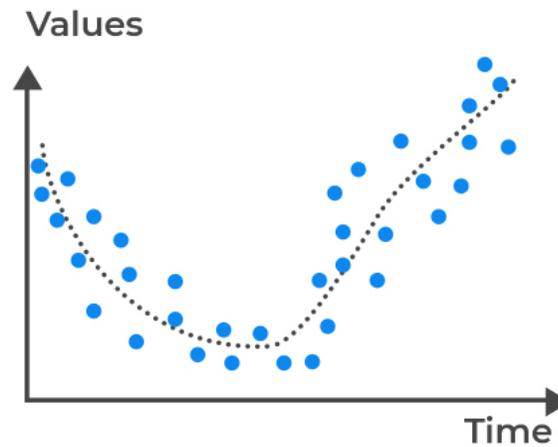

C = 100

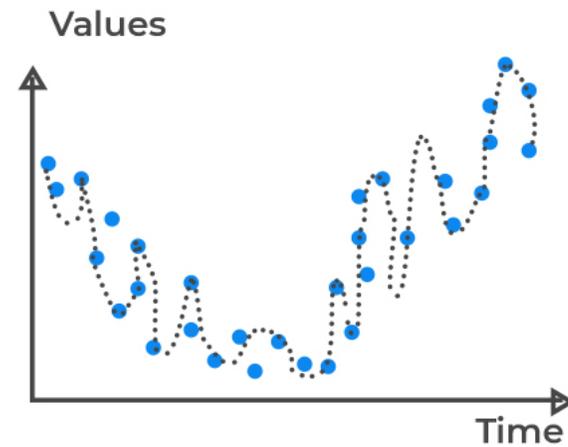

Learning Curve

Underfitted
(High bias error)

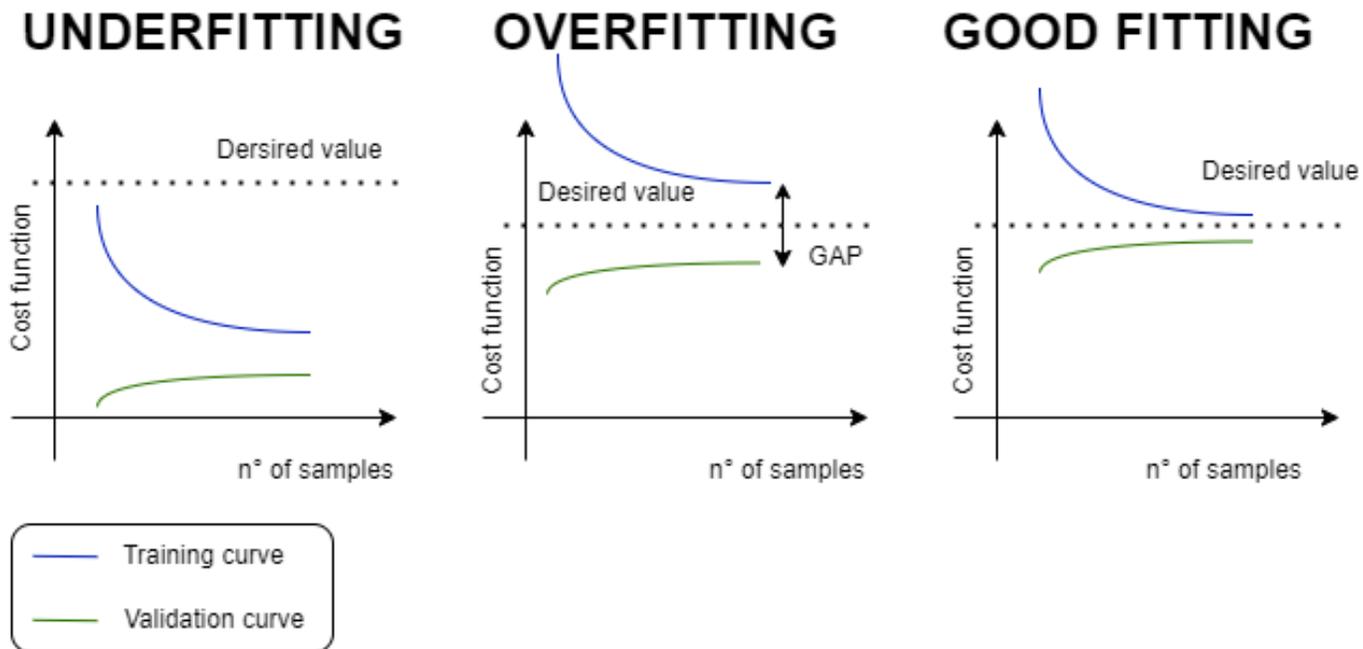

Good Fit/Robust
(Balance between bias and variance)

Overfitted
(High variance error)

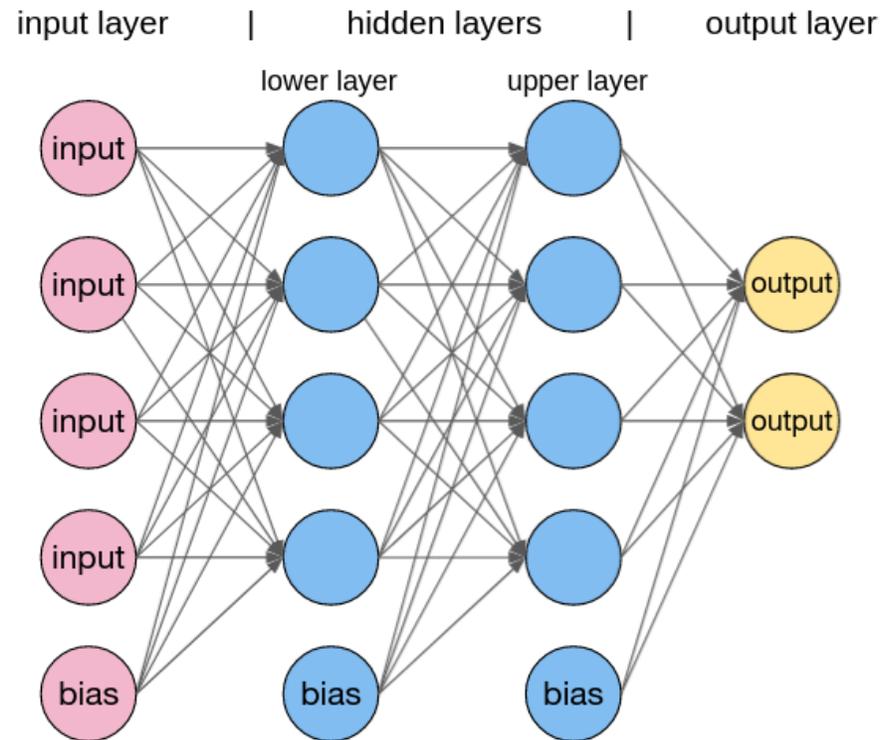

Learning Curve

Graphical representations that show how the performance of a model changes as the amount of training data increases.

MultiLayer Perceptron (MLP)

A type of artificial neural network consisting of multiple layers of neurons

REGINNA^{4.0}

Thank you!
