3D Scanning or Three-dimensional Digitization

3D scanners are tri-dimensional measurement devices used to capture real-world objects or environments so that they can be **remodeled** or **analyzed in the digital world**

(complete or partial 3D measurements of any physical object)

3D Scanning Applications

Collected 3D data is useful for a wide variety of applications:

- Entertainment Industry
- Augmented Reality
- Motion Capture
- Gesture Recognition
- Robotic Mapping
- Industrial Design
- Orthotics and Prosthetics
- **Reverse Engineering** and Prototyping
- **Quality Control/Inspection**
- Digitization of Cultural Artifacts

Reverse Engineering Applications

Forward Engineering

Creating new products from scratch

“Is the traditional approach to product development, in which designers and engineers start with a concept or idea and work through a series of steps to create a final product”

Reverse Engineering

Analyzing and replicating existing products

“Is often used when there is a need to reproduce a product that is no longer available or to modify an existing product to improve its performance”

Capabilities, advantages, constraints and limits of optical systems for Reverse Engineering and Inspection

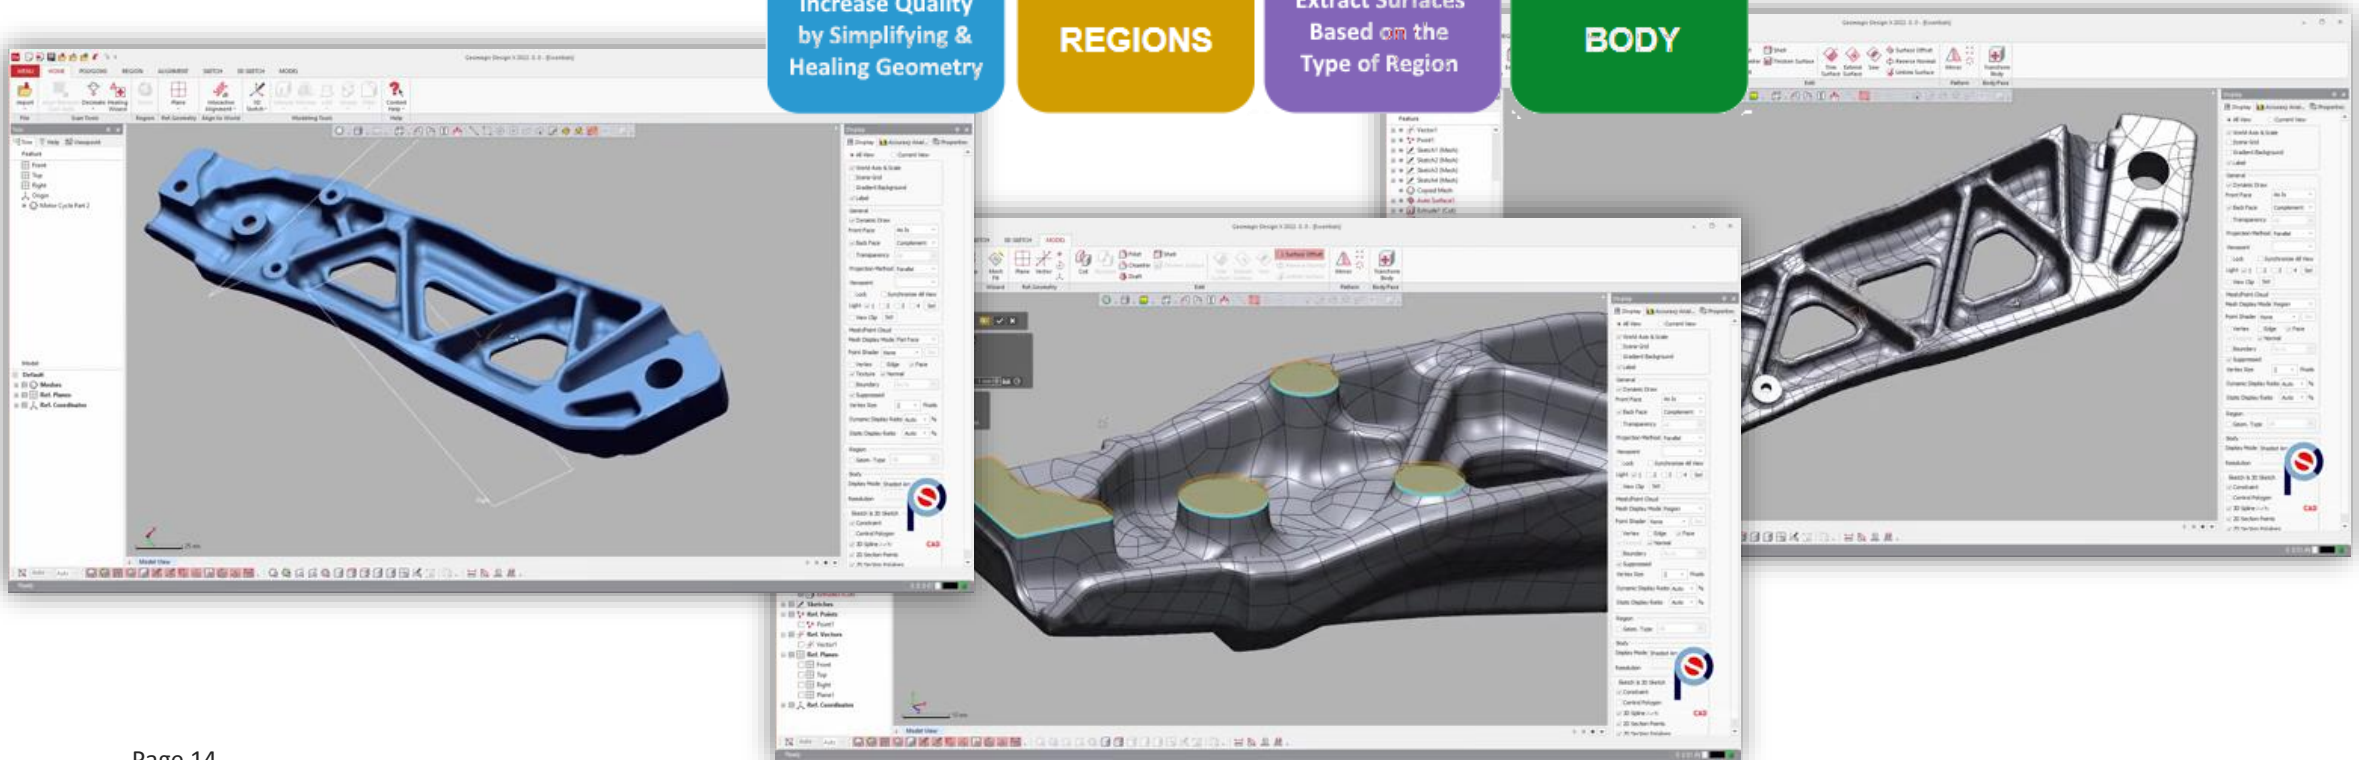

- × **Surface finish of parts (color, metallic shine, etc.)**
- × **Occlusion problems**
- × **Measurement noise (spurious points)**
- × **Tolerances are not too tight**
- × **Non-standardized accuracy**
- ✓ **No contact (does not damage the parts)**
- ✓ **Acquisition of large amounts of data**
- ✓ **Short inspection times**
- ✓ **Measurement of complex surfaces**
- ✓ **No precise positioning of parts required**
